# **The Impact of Artificial Intelligence on Education**

**Prepared by:**

Rahaf Ali

**Personal Portfolio Project July 2026**

## **Introduction**

Artificial Intelligence (AI) is changing many aspects of our lives and is becoming an important part. it is also changing education, Many students and teachers use AI to learn, study, and solve problems.

In this project, I will explain how AI affects education, its advantages, its challenges, and how it may help in the future.

Tab 2

# **What is Artificial Intelligence?**

**Artificial Intelligence (AI) is one of the most important technologies that help people solve problems and learn new things.**

**AI is useful in education and at work.**

**Some of the most popular AI programs are Chat GPT and Gemini. I use AI a lot to learn new languages and to help me with my studies.**

**In my opinion, AI is one of the best technologies developed in recent years, because it helps students and people in many different ways.**

Tab 3

## **Advantages of AI in Education**

Artificial Intelligence has many advantages in education. One of the most important advantages is helping students with their studies. AI is designed to do many different tasks, so Students use it for many educational purposes. For example, it can help them with research, explain lessons, clarify difficult topics, and help them solve questions that they find difficult.

AI can also help teachers. Sometimes teachers find it difficult to explain a lesson or an idea to students. In this case, they can use AI to make the explanation easier and clearer. Then, teachers can explain the lesson to their students in a simple way.

In my opinion, AI is not only useful for studying and school. It can also help students in their daily lives. Students can ask AI questions about different situations. learn how to communicate with children or People with special needs, and get useful advice, AI can also give basic first-aid information in emergency situations, such as when someone is injured or choking. However, AI should not replace doctors or emergency services. It should only be used as guide until professional help arrives

Tab 4

## **Challenges of AI in Education**

Artificial Intelligence is not perfect, and it can make mistakes. Some people also use AI in the wrong way. For example, some students depend on AI to do all their homework without understanding the lessons. Others may use AI to cheat in online exams. In addition, AI is a programmed tool, so its information is not always correct. For this reason, we should not depend on AI completely. We should always search, think carefully, and check the information before trusting it.

Tab 5

## **Future of AI in Education**

I think Artificial Intelligence will continue to develop in the future. It will not only be available as applications on phones, but it will also become a bigger part of schools and universities. I believe students will be allowed to use AI more often at school and at home to support their learning. However, teachers will always have an important role because learning from a person is often clearer and more effective. In my opinion, humans are still better than AI in many ways. In twenty years,

I think AI will be much more advanced than it is today and will be used in almost every area of life, not only in education.

Tab 6

## **Conclusion**

In my opinion, the advantages of Artificial Intelligence are greater than disadvantages. AI has an important role in education because it helps students and teachers in many ways. However, we cannot ignore its disadvantages.

Some people may depend on AI too much instead of thinking by themselves. For this reason, we should use AI wisely and responsibly.

I believe AI should support learning, not replace human thinking.
